Types of Questions on the Test

The Kaiser nursing math test typically includes a variety of question formats designed to assess different areas of mathematical competency. Common types of questions include:

- **Dosage Calculations:** These questions require candidates to calculate medication dosages based on patient weight, concentration, and prescribed amounts.
- **IV Flow Rates:** Candidates must calculate the rate at which intravenous fluids should be administered, often expressed in milliliters per hour or drops per minute.
- **Conversion Problems:** These questions involve converting measurements between different units, such as milligrams to grams or milliliters to liters.

- **Percentage Calculations:** Candidates may need to calculate the percentage of a solution or determine the amount of medication needed based on a given percentage.

Sample Questions

To better understand the types of questions on the Kaiser nursing math test, consider the following examples:

1. **Dosage Calculation:** A patient requires 50 mg of a medication. The available medication is in a concentration of 100 mg per tablet. How many tablets should be administered?
2. **IV Flow Rate:** An IV bag contains 1,000 mL of saline. If the infusion is set to deliver 125 mL per hour, how long will it take to empty the bag?
3. **Conversion:** Convert 2.5 grams to milligrams.
4. **Percentage Problem:** If a solution contains 10% of a drug, how many milligrams are in 50 mL of that solution?
