Understanding the Controls

The Keeley Caverns V2 features several controls that allow you to shape your sound. Understanding these controls is vital to getting the most out of your pedal.

Main Controls

1. **Reverb Control:** This parameter adjusts the level of the reverb effect. Turning it up will increase the depth and presence of the reverb in your sound.
2. **Delay Control:** Similar to the reverb control, this knob adjusts the amount of delay effect added to your signal. Higher settings will create more pronounced echoes.
3. **Tone Control:** This control adjusts the high-frequency response of the reverb effect. A higher setting will result in a brighter sound, while a lower setting will produce a darker tone.
4. **Mix Control:** This knob allows you to blend the dry signal with the wet (effected) signal. Setting it to 12 o'clock provides a 50/50 mix, while turning it towards the right increases the wet signal.
5. **Modulation Control:** This feature adds a subtle modulation effect to the reverb, creating a lush, swirling ambiance. Adjusting this control changes the intensity of the modulation.

Additional Features

- **Footswitch:** The pedal features a sturdy footswitch that allows you to engage or bypass the effect easily.
- **Expression Pedal Control:** When an expression pedal is connected, it can be assigned to control various parameters such as reverb, delay, or modulation depth.
- **Switchable Modes:** The Caverns V2 offers different modes for reverb and delay, enabling users to select their desired sound character easily.
