Pharmacology and Mechanism of Action

Ketorolac tromethamine 60 mg 2ml injection solution belongs to the class of nonsteroidal anti-inflammatory drugs (NSAIDs). It exerts its analgesic, anti-inflammatory, and antipyretic effects primarily by inhibiting cyclooxygenase (COX) enzymes, specifically COX-1 and COX-2. These enzymes are involved in the biosynthesis of prostaglandins, which mediate pain, inflammation, and fever. By blocking prostaglandin synthesis, ketorolac reduces the sensitization of nerve endings to pain stimuli and suppresses inflammatory responses.

The injectable formulation allows for rapid systemic absorption, providing prompt pain relief. Ketorolac's pharmacokinetics include a relatively short half-life, necessitating careful dosing intervals to maintain therapeutic effects while minimizing toxicity. It is metabolized hepatically and excreted primarily via the kidneys, which underscores the importance of renal function monitoring during therapy.

Pharmacokinetics

After intramuscular or intravenous administration, ketorolac achieves peak plasma concentrations quickly, often within 30 to 60 minutes. The bioavailability of the injectable form is nearly 100%, ensuring effective plasma levels. The drug's half-life ranges from 4 to 6 hours, which informs the recommended dosing frequency. Elimination is mainly renal, with dose adjustments required in patients with impaired kidney function to prevent accumulation and toxicity.

Indications and Clinical Uses

Ketorolac tromethamine 60 mg 2ml injection solution is indicated for the short-term management of moderate to severe acute pain that requires analgesia at the opioid level. It is particularly useful in postoperative pain management and in situations where oral administration is not feasible or effective. Its effectiveness in reducing the need for opioid analgesics makes it valuable in multimodal pain control strategies.

Common Clinical Applications

- Postoperative pain control following surgical procedures such as orthopedic, gynecological, and dental surgeries
- Acute musculoskeletal pain including sprains, strains, and trauma-related injuries
- Renal colic and other acute visceral pain conditions
- Short-term management of moderate to severe pain when non-opioid analgesics are inadequate

Dosage and Administration Guidelines

The recommended dose of ketorolac tromethamine 60 mg 2ml injection solution varies depending on the indication, patient age, weight, and renal function. Generally, the injection is administered either intramuscularly or intravenously, with the intravenous route preferred in hospital settings for rapid onset. The maximum duration of treatment should not exceed five days to reduce the risk of adverse effects.

Standard Dosing Recommendations

- Initial dose: 60 mg intramuscularly or 30 mg intravenously for adults
- Maintenance dose: 30 mg intramuscularly or intravenously every 6 hours as needed

- Maximum daily dose: 120 mg (to avoid toxicity)
- Duration: Not to exceed 5 days of continuous therapy
- Use caution and dose adjustments in elderly patients and those with renal impairment

Side Effects and Adverse Reactions

While ketorolac tromethamine 60 mg 2ml injection solution is effective for pain control, its use is associated with potential side effects, some of which can be serious. The most common adverse effects relate to the gastrointestinal, renal, and hematologic systems due to the drug's prostaglandin inhibition.

Common and Serious Adverse Effects

- Gastrointestinal discomfort, including nausea, vomiting, and dyspepsia
- Gastrointestinal bleeding, ulceration, and perforation, especially with prolonged use
- Renal impairment or acute kidney injury, particularly in patients with preexisting renal conditions
- Increased risk of bleeding due to platelet function inhibition
- Hypersensitivity reactions such as rash, itching, or anaphylaxis
- Central nervous system effects including headache, dizziness, and somnolence

Contraindications and Precautions

Ketorolac tromethamine 60 mg 2ml injection solution is contraindicated in several patient populations due to risks of severe adverse events. Proper screening and monitoring are essential before initiating therapy to avoid complications.

Key Contraindications

- Known hypersensitivity to ketorolac, aspirin, or other NSAIDs
- Active or history of peptic ulcer disease or gastrointestinal bleeding
- Patients with advanced renal impairment or at risk of renal failure

- Concurrent use with other NSAIDs or anticoagulants that increase bleeding risk
- Pregnancy, especially in the third trimester
- Patients undergoing coronary artery bypass graft (CABG) surgery

Precautions for Use

Careful assessment of patient history and comorbidities is necessary to minimize risks. Monitoring renal function, liver enzymes, and complete blood counts during treatment is advisable. The drug should be used at the lowest effective dose for the shortest duration possible, particularly in elderly patients and those with cardiovascular or renal disorders.

Drug Interactions

Ketorolac tromethamine 60 mg 2ml injection solution can interact with various medications, potentially affecting efficacy or increasing adverse effects. Awareness of these interactions is critical for safe pharmacotherapy.

Important Drug Interactions to Note

- Anticoagulants (e.g., warfarin) – increased risk of bleeding
- Other NSAIDs or salicylates – additive gastrointestinal and renal toxicity
- Diuretics and antihypertensives – reduced efficacy and increased risk of renal impairment
- Selective serotonin reuptake inhibitors (SSRIs) – increased bleeding risk
- Probenecid – may increase plasma concentration of ketorolac

Storage and Handling

Ketorolac tromethamine 60 mg 2ml injection solution should be stored under appropriate conditions to maintain its stability and effectiveness. Proper handling in clinical settings ensures safe administration and minimizes contamination risks.

Storage Recommendations

- Store at controlled room temperature, typically between 20 to 25°C (68 to 77°F)
- Protect from light and moisture
- Keep the solution in its original packaging until use
- Discard any unused portion after the recommended period to avoid microbial contamination
- Ensure that the solution is clear and free from particulate matter before administration
