- **Cell Division:** Mitosis and meiosis for growth, repair, and reproduction.
- **Cell Communication:** Signaling mechanisms that coordinate cellular activities.

Tissues and Their Functions

Tissues are groups of similar cells that work together to perform specific functions, making them a vital topic in lecture exam 1 anatomy and physiology. There are four primary tissue types in the human body.

Types of Tissues

Each tissue type has distinct characteristics and roles in the body's structure and function.

- **Epithelial Tissue:** Covers body surfaces and lines cavities; involved in protection, absorption, and secretion.
- **Connective Tissue:** Supports, binds, and protects organs; includes bone, blood, and

cartilage.

- **Muscle Tissue:** Responsible for movement; includes skeletal, cardiac, and smooth muscle.
- **Nervous Tissue:** Conducts electrical impulses for communication and control.

Tissue Functions and Locations

Understanding where tissues are located and their functions is essential for success in lecture exam 1 anatomy and physiology.

- **Epithelial Tissue:** Found in skin, lining of digestive tract, and glands.
- **Connective Tissue:** Located throughout the body, including tendons, ligaments, and fat storage areas.
- **Muscle Tissue:** Attached to bones, heart walls, and walls of hollow organs.
- **Nervous Tissue:** Located in the brain, spinal cord, and peripheral nerves.

The Integumentary System Overview

The integumentary system is a major topic in lecture exam 1 anatomy and physiology, focusing on the skin and its accessory structures. This system serves as the body's first line of defense and has multiple crucial functions.

Structure of the Skin

The skin consists of three primary layers, each with specific roles:

- **Epidermis:** The outermost layer providing a waterproof barrier and protection.
- **Dermis:** Contains connective tissue, blood vessels, nerve endings, and glands.
- **Hypodermis (Subcutaneous layer):** Made of fat and connective tissue that insulates the body and cushions organs.

Functions of the Integumentary System

This system performs several vital functions that are often tested in lecture exam 1

anatomy and physiology:

- **Protection:** Shields internal tissues from injury, UV radiation, and pathogens.
- **Sensation:** Contains sensory receptors for touch, pain, and temperature.
- **Thermoregulation:** Regulates body temperature through sweat production and blood flow.
- **Vitamin D Synthesis:** Initiates production of vitamin D when exposed to sunlight.
- **Excretion:** Eliminates waste products through sweat glands.
