7. Collaboration: Working closely with developers, product managers, and other stakeholders to ensure quality assurance throughout the development process.
8. User Acceptance Testing (UAT): Assisting end-users in testing the software to ensure it meets their needs and expectations.

Types of Manual Testing

Manual testing can be categorized into several types, each serving a unique purpose:

- Functional Testing: Validates the software against functional requirements.
- Smoke Testing: A preliminary test to check the basic functionality of the application.
- Sanity Testing: Ensures that a particular function or bug has been fixed after changes in the code.

- Integration Testing: Verifies that different modules or services of the application work together as intended.
- Usability Testing: Assesses the user interface and user experience to ensure the application is intuitive and easy to use.
- Exploratory Testing: Involves exploring the application without predefined test cases to discover defects.
