Toolpath Generation

Once the design is complete, the next step is to generate toolpaths for CNC machining. Mastercam X4 offers numerous strategies for toolpath creation:

1. Contour Toolpath

The contour toolpath is used for cutting the outline of a part. To create a contour toolpath:

1. Select the contour feature from the Toolpath menu.
2. Choose the geometry you wish to cut.
3. Define the tool parameters, including type and size.
4. Set the cutting parameters, such as feed rate and spindle speed.

2. Pocket Toolpath

Pocket toolpaths are used for machining areas that are recessed or sunken into the material. To create a pocket toolpath:

1. Select the pocketing feature.
2. Choose the geometry for the pocket area.
3. Define the tool and cutting parameters.
4. Specify the depth of cut and the number of passes.

3. Drilling Toolpath

Drilling toolpaths are designed for creating holes. The process involves:

1. Selecting the drilling feature from the Toolpath menu.
2. Choosing the locations for the holes.
3. Defining the drill tool and parameters.
4. Setting the feed rate and retract height.
