Key Components of Canine Anatomy

Miller's Anatomy of the Dog systematically breaks down the anatomy into various systems. Here are some of the key components:

Skeletal System

The skeletal system provides structure and support for the dog's body. It consists of:

1. **Skull:** Protects the brain and supports facial structures.
2. **Vertebral Column:** Composed of vertebrae that protect the spinal cord.
3. **Rib Cage:** Encloses and protects vital organs such as the heart and lungs.
4. **Limbs:** Includes bones of the forelimbs (humerus, radius, and ulna) and hindlimbs (femur, tibia, and fibula).

Muscular System

The muscular system is responsible for movement and stability. Key points include:

- **Skeletal Muscles:** These are voluntary muscles that enable movement.
- **Cardiac Muscle:** Involuntary muscle that makes up the heart.
- **Smooth Muscles:** Involuntary muscles found in organs and blood vessels.

Circulatory System

The circulatory system is vital for transporting nutrients and oxygen throughout the body. It consists of:

1. **Heart:** A muscular organ that pumps blood.
2. **Blood Vessels:** Includes arteries, veins, and capillaries.
3. **Blood:** Composed of red blood cells, white blood cells, platelets, and plasma.

Respiratory System

The respiratory system is essential for gas exchange. It includes:

- **Nasal Cavity:** Filters, warms, and humidifies air.
- **Trachea:** Connects the nasal cavity to the lungs.
- **Lungs:** Main organs for gas exchange.
