- **Stoichiometric Uses:** Apply molarity in reaction calculations to find

limiting reagents, product amounts, or reactant volumes.

Familiarity with these problem types provides a solid foundation for tackling worksheet questions and related assessments efficiently.

Step-by-Step Solutions for Sample Problems

The molarity worksheet 2 answer key often includes detailed walkthroughs of sample problems to illustrate correct approaches. These step-by-step solutions emphasize clarity and logical progression, facilitating better comprehension.

Example Problem 1: Calculating Molarity

Problem: Calculate the molarity of a solution containing 0.5 moles of sodium chloride dissolved in 2 liters of solution.

Solution:

1. Identify the formula for molarity: $M = \frac{\text{moles of solute}}{\text{liters of solution}}$.
2. Substitute values: $M = \frac{0.5 \text{ moles}}{2 \text{ L}}$.
3. Calculate: $M = 0.25 \text{ mol/L}$.

The molarity of the solution is 0.25 M.

Example Problem 2: Dilution Calculation

Problem: What volume of a 6 M hydrochloric acid solution is needed to prepare 1.5 L of 1 M solution?

Solution:

1. Apply the dilution formula: $M_1V_1 = M_2V_2$.

2. Known values: $M_1 = 6 \text{ M}$, $M_2 = 1 \text{ M}$, $V_2 = 1.5 \text{ L}$.
3. Calculate V_1 : $V_1 = \frac{M_2 V_2}{M_1} = \frac{1 \times 1.5}{6} = 0.25 \text{ L}$.

Thus, 0.25 liters (250 mL) of the 6 M solution is required.
