Sample Problems and Solutions in Nuclear Chemistry

The nuclear chemistry review worksheet answer key commonly includes a variety of sample problems to illustrate key concepts. These examples demonstrate how to approach and solve typical questions encountered in assessments. Below are representative problem types with explanations reflecting the style found in answer keys.

Example 1: Alpha Decay Equation

Problem: Write the nuclear equation for the alpha decay of Uranium-238.

Answer: The alpha decay of Uranium-238 can be represented as:

1. Identify the emitted particle: alpha particle (He-4 nucleus), represented as ${}^4_2\text{He}$.
2. Subtract the alpha particle's mass number and atomic number from Uranium-238 (mass number 238, atomic number 92).
3. The resulting daughter nucleus is Thorium-234 (${}^{234}_{90}\text{Th}$).

The balanced nuclear equation is: ${}^{238}_{92}\text{U} \rightarrow {}^{234}_{90}\text{Th} + {}^4_2\text{He}$

Example 2: Half-Life Calculation

Problem: Calculate the remaining mass of a 100 g sample of Carbon-14 after 11,460 years, given its half-life is 5,730 years.

Answer: The number of half-lives elapsed is $11,460 / 5,730 = 2$.

Remaining mass = Initial mass $\times (1/2)^{\text{(number of half-lives)}} = 100 \text{ g} \times (1/2)^2 = 100 \text{ g} \times 1/4 = 25 \text{ g}$.

Example 3: Beta Decay Equation

Problem: Write the nuclear equation for the beta decay of Carbon-14.

Answer: In beta decay, a neutron converts into a proton, emitting an electron (beta particle) and an antineutrino. The atomic number increases by 1, and the mass number remains unchanged.

Equation: ${}^{14}_6\text{C} \rightarrow {}^{14}_7\text{N} + {}^0_{-1}\text{e}$
