Overview of the Human Body Organs

The human body comprises numerous organs that work together to maintain essential functions. These organs are categorized into systems that perform specific roles, such as the digestive system, respiratory system, and circulatory system. Here's a brief overview of some major organs and their functions:

Major Organs and Their Functions

1. Heart:
 - Pumps blood throughout the body.
 - Supplies oxygen and nutrients to tissues.
 - Removes carbon dioxide and waste products.
2. Lungs:
 - Facilitate gas exchange (oxygen in, carbon dioxide out).
 - Aid in the process of respiration.
3. Liver:
 - Processes nutrients from food.
 - Produces bile for digestion.
 - Detoxifies harmful substances.
4. Kidneys:
 - Filter blood to remove waste products.
 - Regulate fluid and electrolyte balance.
 - Produce urine.
5. Brain:
 - Controls thoughts, memory, emotions, and movement.
 - Coordinates body functions through the nervous system.

6. Stomach:

- Breaks down food using acids and enzymes.
- Mixes food with digestive juices.

7. Intestines (Small and Large):

- Small intestine absorbs nutrients and minerals.
- Large intestine absorbs water and forms waste.

8. Skin:

- Protects internal organs.
- Regulates temperature.
- Aids in sensation.

9. Pancreas:

- Produces insulin and glucagon for blood sugar regulation.
- Secretes digestive enzymes.

10. Spleen:

- Filters and recycles red blood cells.
- Plays a role in immune response.

Each organ performs a unique function, but they must work together for the body to function optimally.
