Sample Worksheet Questions and Answers

Comprehension Questions

1. What are the primary functions of photosynthesis?
- Answer: Photosynthesis allows plants to convert sunlight into energy, producing oxygen and glucose.
2. Name three adaptations that plants have developed to survive in harsh environments.
- Answer:
 - Thick, waxy leaves to reduce water loss.
 - Deep root systems to access underground water.
 - Ability to store water in tissues (e.g., succulents).
3. How do plants contribute to the carbon cycle?
- Answer: Plants absorb carbon dioxide from the atmosphere during photosynthesis and release oxygen, thus playing a crucial role in regulating atmospheric carbon levels.

Vocabulary Exercises

1. Define "photosynthesis".
- Answer: Photosynthesis is the process by which green plants and some other organisms use sunlight to synthesize foods with the help of chlorophyll, converting carbon dioxide and water into glucose and oxygen.

2. What does "biodiversity" mean?

- Answer: Biodiversity refers to the variety of life in a particular habitat or ecosystem, including the variety of species, genetic variation, and ecosystem complexity.

Research Assignments

1. Choose a plant species featured in the series and describe its habitat, adaptations, and significance.

- Answer: (Responses will vary based on the chosen species. Students should provide detailed descriptions based on their research.)

Creative Projects

1. Create a poster illustrating the life cycle of a flowering plant. Include labels for each stage.

- Answer: (Responses will vary; students should create a visual representation that accurately depicts the life cycle stages: seed, germination, seedling, flowering, pollination, and seed dispersal.)

Using the Answer Key Effectively

Educators should utilize the answer key not only for grading but also as a tool for discussion.
