Structure and Content

The textbook is divided into several chapters, each focusing on specific areas of statistics. Key sections include:

1. Descriptive Statistics: This section covers methods for summarizing and describing the features of a dataset. Important topics include:
 - Measures of central tendency (mean, median, mode)
 - Measures of variability (range, variance, standard deviation)
 - Data visualization techniques (histograms, box plots, scatter plots)
2. Probability: Understanding probability is crucial for statistical inference. This chapter introduces:
 - Basic probability concepts (experiments, sample spaces, events)
 - Rules of probability (addition and multiplication rules)
 - Conditional probability and independence
3. Distributions: This portion discusses various probability distributions, such as:
 - Normal distribution
 - Binomial distribution
 - Poisson distribution
 - t-distribution
4. Inferential Statistics: This section emphasizes making inferences about populations based on sample data. Key topics include:
 - Estimation (point estimates and confidence intervals)
 - Hypothesis testing (null and alternative hypotheses, type I and type II errors)
 - p-values and significance levels

5. Regression Analysis: Mann addresses the relationship between variables through:

- Simple linear regression
- Multiple regression
- Interpretation of regression coefficients

6. Non-parametric Tests: The book also introduces non-parametric methods when standard assumptions do not hold, covering tests such as:

- Chi-square tests
- Mann-Whitney U test
- Wilcoxon signed-rank test

7. Statistical Quality Control: This chapter explores the application of statistics in quality control processes, emphasizing:

- Control charts
- Process capability analysis
