Reinforcing Economic Skills Answer Key

To further assist students and educators, below is a sample answer key that accompanies common economic problems and exercises. This answer key provides guidance on how to approach and solve typical economic questions.

Sample Economic Problems and Answers

1. Problem: Calculate the opportunity cost of attending college instead of working full-time.
- Answer: Opportunity cost is the income foregone by not working full-time. If a full-time job pays \$30,000 per year and college costs \$10,000 per year, the opportunity cost is \$30,000.
2. Problem: Explain the law of demand.
- Answer: The law of demand states that, all else being equal, as the price of a good decreases, the quantity demanded increases, and vice versa.
3. Problem: What is GDP and how is it calculated?
- Answer: Gross Domestic Product (GDP) is the total value of all goods and services produced in a country over a specific period. It is calculated using the formula: $GDP = C + I + G + (X - M)$, where C = consumption, I = investment, G = government spending, X = exports, and M = imports.
4. Problem: Define elasticity and provide an example.
- Answer: Elasticity measures how much the quantity demanded or supplied of a good responds to a change in price. For example, if the price of a luxury car increases by 10% and the quantity demanded decreases by 20%, the elasticity of demand is -2 (indicating elastic demand).
5. Problem: Analyze the impact of a price ceiling on the housing market.
- Answer: A price ceiling, which sets a maximum price for housing, can lead to a shortage of available rental units. When prices are artificially kept low, demand increases while supply decreases, resulting in fewer units being available and potential black markets.
