Basic Rest Assured Interview Questions

Basic questions on Rest Assured focus on fundamental concepts and the core functionality of the tool. These questions help interviewers understand whether the candidate has a solid foundation in REST API testing using Rest Assured.

What is Rest Assured and why is it used?

Rest Assured is an open-source Java library designed for testing and validating RESTful web services. It simplifies the process of writing tests for HTTP requests, supports various HTTP methods (GET, POST, PUT, DELETE), and allows easy validation of responses. It is widely used because it integrates smoothly with Java testing frameworks, offers a fluent syntax for writing readable tests, and supports JSON and XML parsing.

How do you send a GET request using Rest Assured?

To send a GET request, you use the *given()* method to specify request parameters or headers, followed by *when()* to define the HTTP method and endpoint, and then *then()* to assert the response. For example:

```
given().  
when().  
get("https://api.example.com/resource").  
then().  
statusCode(200);
```

What are the common HTTP methods supported by Rest Assured?

Rest Assured supports all standard HTTP methods, including:

- GET - Retrieve data from the server
- POST - Submit data to the server
- PUT - Update existing data
- DELETE - Remove data
- PATCH - Partially update resources
- HEAD - Retrieve headers without the response body

Intermediate Rest Assured Interview Questions

Intermediate questions delve deeper into the practical usage and customization of Rest Assured tests, focusing on parameterization, authentication, response validation, and integration with other tools.

How can you validate JSON response body in Rest Assured?

Rest Assured provides built-in support for JSON path expressions, allowing easy extraction and validation of values inside JSON responses. The *body()* method is used with Hamcrest matchers to assert specific values. Example:

```
given().  
when().
```

```
get("/users/1").  
then().  
body("name", equalTo("John Doe")).  
body("age", greaterThan(20));
```

Explain how to handle query parameters and path parameters in Rest Assured.

Query parameters are appended to the URL and can be specified using the *queryParam()* or *queryParams()* methods. Path parameters are dynamic parts of the URL and are set using the *pathParam()* or *pathParams()* methods. For example:

```
given().  
queryParam("page", 2).  
pathParam("userId", 10).  
when().  
get("/users/{userId}").  
then().  
statusCode(200);
```

What types of authentication does Rest Assured support?

Rest Assured supports several authentication mechanisms including:

- Basic Authentication
- Digest Authentication
- OAuth 1 and OAuth 2
- Form-based Authentication
- Preemptive Authentication

These can be implemented using the *auth()* method chain in the request specification.

Advanced Rest Assured Interview Questions

Advanced questions test knowledge of complex scenarios, advanced configuration, performance optimization, and integration with other frameworks and tools.

How do you handle cookies and sessions in Rest Assured?

Rest Assured provides methods to manage cookies in requests and responses. Cookies can be set using the `cookie()` method and extracted from responses using the `extract()` method. Managing sessions often involves capturing session cookies and sending them with subsequent requests to maintain state.

Describe how to use filters in Rest Assured and their benefits.

Filters in Rest Assured are used to intercept requests and responses for logging, modifying requests, or adding custom behavior such as authentication or metrics collection. They act like middleware and enhance test flexibility. Filters can be added using the `filter()` method and enable detailed request/response inspection or modifications.

How can you integrate Rest Assured with TestNG or JUnit frameworks?

Rest Assured tests can be executed within TestNG or JUnit by embedding Rest Assured calls inside test methods annotated with `@Test`. This integration allows leveraging features such as test suites, parallel execution, assertions, and reporting. Proper setup of dependencies and test runners is required for seamless integration.

Explain how to validate XML responses using Rest Assured.

Rest Assured supports XML response validation through XML path expressions. Similar to JSON, the `body()` method is used with XML path to assert specific elements or attributes. For example:

```
given().  
when().  
get("/employees/1").  
then().  
body("employee.name", equalTo("Alice"));
```
