Salesforce Fundamentals

Understanding the core concepts of Salesforce is crucial for any interview candidate. This section covers common questions related to Salesforce architecture, cloud offerings, and basic terminologies.

What is Salesforce and its main features?

Salesforce is a cloud-based Customer Relationship Management (CRM) platform designed to help businesses manage customer data, sales, service, and marketing processes. Its main features include Sales Cloud, Service Cloud, Marketing Cloud, and Salesforce Platform, which offer tools for automation, analytics, and custom application development.

Explain the Salesforce multi-tenant architecture.

Salesforce operates on a multi-tenant architecture where multiple customers share the same infrastructure and resources securely. This model allows efficient resource usage, automatic upgrades, and scalability without affecting individual users' data or performance.

What are the different types of Salesforce clouds?

Salesforce offers various cloud services tailored to different business needs:

- **Sales Cloud:** Automates sales processes.
- **Service Cloud:** Supports customer service and support.
- **Marketing Cloud:** Manages marketing campaigns.
- **Commerce Cloud:** Enables e-commerce solutions.
- **Community Cloud:** Builds online communities.
- **Analytics Cloud:** Provides business intelligence tools.

Apex Programming Questions

Apex is Salesforce's proprietary programming language, similar to Java, used for backend development. This section focuses on interview questions related to Apex syntax, triggers, classes, and best practices.

What is Apex and where is it used?

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Salesforce platform. It is primarily used to write triggers, classes, and batch processes to customize Salesforce functionality.

Explain the difference between triggers and classes in Apex.

Triggers are pieces of Apex code that execute before or after data manipulation language (DML) events on Salesforce records, such as insert, update, or delete. Classes are reusable blocks of code that encapsulate logic, can be instantiated, and called from triggers, Visualforce pages, or Lightning components.

What are governor limits in Salesforce?

Governor limits are runtime limits enforced by Salesforce to ensure efficient resource usage and prevent monopolization of shared resources. These limits restrict the number of records processed, SOQL queries, CPU time, and more within a single transaction.

- 100 SOQL queries per transaction
- 150 DML statements per transaction
- 10,000 records retrieved by SOQL queries
- 6 MB heap size per transaction

Visualforce and Lightning Components

This section addresses questions related to Salesforce's user interface frameworks: Visualforce and Lightning Components. These technologies enable custom UI development and user experience enhancement.

What is Visualforce?

Visualforce is a component-based UI framework that allows developers to build custom user interfaces using markup language and Apex controllers. It provides tags that represent UI components, and these pages can be integrated into Salesforce applications.

Describe Lightning Components and their advantages.

Lightning Components is a modern UI framework for developing dynamic web apps for mobile and desktop devices. It uses JavaScript on the client side and Apex on the server side, supporting faster development, better performance, and a responsive interface compared to Visualforce.

When to use Visualforce vs. Lightning Components?

Visualforce is suitable for traditional, page-centric applications and scenarios requiring complex server-side logic. Lightning Components are preferred for modern, dynamic, and mobile-friendly user interfaces with rich client-side interactions.

Data Management and Security

Data integrity, access control, and security are critical in Salesforce. This section discusses common interview questions about data models, sharing rules, and security settings.

What are Salesforce objects and how are they classified?

Salesforce objects represent database tables that store data. They are classified as:

- **Standard Objects:** Predefined by Salesforce, such as Account, Contact, Opportunity.
- **Custom Objects:** Created by users to store data unique to an organization.

Explain the difference between profiles and roles.

Profiles control users' permissions and access to objects, fields, and functionalities. Roles define the hierarchy for record-level access and data visibility, usually used in sharing rules and territory management.

What are sharing rules in Salesforce?

Sharing rules open up record access to users based on criteria or ownership, overriding the default organization-wide sharing settings. They help extend access to groups or roles without changing profiles or roles.

Salesforce Administration

This section covers questions related to day-to-day administration tasks in Salesforce, including user management, automation tools, and configuration settings.

How do you create a workflow rule?

Workflow rules automate standard internal procedures by triggering actions based on criteria. To create a workflow rule:

1. Define the evaluation criteria (when the rule runs).

2. Set rule criteria (conditions to be met).
3. Specify workflow actions such as field updates, email alerts, tasks, or outbound messages.

What is the difference between a workflow rule and a process builder?

Workflow rules are simple automation tools limited to immediate or time-triggered actions. Process Builder is a more advanced visual tool allowing multiple if-then conditions, record updates, and invoking other processes, providing greater flexibility.

How can you import data into Salesforce?

Data can be imported using tools like Data Loader, Data Import Wizard, or third-party ETL tools. Data Loader supports large volumes and complex operations, while Data Import Wizard is easier for simple data loads involving standard objects.

Scenario-Based and Behavioral Questions

Interviewers often assess problem-solving skills and practical knowledge through scenario-based questions. This section highlights examples and best approaches to answer such questions effectively.

How would you handle a trigger that exceeds governor limits?

To handle governor limits in triggers, use bulkification techniques such as processing records in batches, minimizing SOQL queries inside loops, and using collections like lists and maps. Additionally, consider asynchronous processing using future methods or batch Apex.

Describe a situation where you implemented a custom solution in Salesforce.

When answering, focus on the business problem, the Salesforce features or custom development used, the implementation process, and the outcome. Emphasize technical skills and the impact on efficiency or user experience.

How do you stay updated with Salesforce releases and new features?

Staying current involves reviewing Salesforce release notes, participating in Trailhead modules, joining Salesforce communities, and attending webinars or events. Continuous learning is essential in the rapidly evolving Salesforce ecosystem.

Frequently Asked Questions

What is Salesforce and why is it widely used?

Salesforce is a cloud-based Customer Relationship Management (CRM) platform that helps businesses manage their sales, customer service, marketing, and more. It is widely used due to its scalability, customization options, and comprehensive suite of tools for managing customer relationships efficiently.

Explain the difference between a role and a profile in Salesforce.

In Salesforce, a profile controls the object-level and field-level access for users, defining what users can do within the system. A role, on the other hand, controls the record-level access by defining a hierarchy that determines data visibility and sharing among users.

What are Governor Limits in Salesforce?

Governor Limits are runtime limits enforced by Salesforce to ensure efficient processing and to prevent resource monopolization in a multitenant environment. These limits restrict the number of records processed, SOQL queries, DML statements, and other operations in a single transaction.

What is a Trigger in Salesforce?

A Trigger is Apex code that executes before or after data manipulation language (DML) events occur on Salesforce records, such as before insert, after update, or before delete. Triggers are used to perform custom actions like validation or complex business logic.

How can you implement batch processing in Salesforce?

Batch processing in Salesforce can be implemented using the Batch Apex interface, which allows processing of large volumes of records asynchronously in manageable chunks. Developers implement the start, execute, and finish methods to define the batch job's behavior.

What are the different types of relationships in Salesforce?

Salesforce supports several relationship types, including Lookup Relationship (a loose link between objects),

Master-Detail Relationship (a tight link with cascade delete and sharing), and Many-to-Many Relationship (using a junction object to relate records from two objects).

What is the difference between a standard object and a custom object in Salesforce?

Standard objects are pre-built objects provided by Salesforce, such as Account, Contact, and Opportunity. Custom objects are user-defined objects created to store information unique to a company's business processes.

What is a Salesforce Lightning Component?

A Salesforce Lightning Component is a modular, reusable building block for creating user interfaces in the Lightning Experience. Lightning Components use the Aura framework or Lightning Web Components (LWC) to build dynamic, responsive web applications on the Salesforce platform.

How do you handle exceptions in Apex?

Exceptions in Apex are handled using try-catch blocks. The code that might throw an exception is placed inside the try block, and the catch block contains code to handle the exception gracefully. Developers can also use custom exceptions by extending the Exception class.
